

Benefits of Hydroseeding from RAINBOW LAWCARE

Hydroseeding is designed to grow a green healthy lawn from the soil up. Our hydroseeding service combines seed, fertilizer, hydromulch, and water in a customized blend that will work best on your lawn.

Hydroseeding is a great way to establish a lawn without the high costs of sodding, and the inconsistent results than can happen with traditional seeding methods.

Hydroseeding promotes a deeper root system and avoids the problems that can happen with sod that was grown on a different soil. Hydroseeding gives proven results the first time it is installed and the seeds are more resistant to external problems because it is grown from your soil and not a sod farm. Hydroseeding soils hold moisture better, which allows for the seeds to germinate faster.

Hydroseeded lawns that are correctly watered can start to grow in less than 7 days, and under normal conditions, can be established and ready to mow in 3-4 weeks.

With hydroseedings' ability to retain up to 10 times its weight in water, it's definitely proved to be the best method for fast, healthy germination, high plant survival and protection of seeds with a moisture sealant. ***No other method of growing grass, whether sod or hand seeding, has the advantages of hydroseeding when it comes to water retention.***

Why choose Hydroseeding?

- Establishes quicker than traditional seeding methods
- Higher germination rates
- Produces a lawn with a deeper root system
- Costs 50% or more less than sod
- Requires less water than sod or traditional seed
- Prevents erosion and won't wash away
- Customized for your lawn
 - Seed varieties are chosen based on color, traffic patterns, soil conditions, and sun exposure
