Fungicide Services

About The Service:

Our fungicide is granular and is applied throughout the entire property or specified areas. It will stop the infection and prevent any further spread of the disease. It can take a few weeks for the brown spots to grow out and turn green again.

Pre-application Care:

- We recommend not watering before we arrive on the day of service so the soil is not too saturated for our equipment

Post-application Care:

- Our technicians will leave a lawn sign in the ground near the street once the service is complete
- You will receive your invoice once the service is complete in an After Service Summary Email
- Wait 24 hours to mow after the application
- It is recommended to water in the fungicide the day of application

General Mowing Guidelines:

- Set the height of mower blade between 3-4 inches
- Each time you mow, cut no more than ⅓ of the grass height
- We recommend mulching your clippings instead of bagging; the clippings are an excellent source of nitrogen

General Watering Guidelines:

As a rule of thumb, your lawn needs 1"- 1 ½" of water per week. The following rules will help you determine whether to water:

- When temperatures exceed 85 degrees, watering is highly recommended and should be increased to avoid dormancy and browning of turf
- In general, it is more beneficial to water less often and more deeply. This helps promote deep root growth, which, in turn, allows your grass to go longer between watering
- Shady areas need less water than sunny areas. Likewise, low areas require less water than hills
- Under watering leads to dormancy. It can take a week of watering to have a dormant lawn green up again
- Water in the morning, rather than in the evening or mid-day. This allows more water to penetrate the soil, increasing your watering efficiency, and can help prevent fungal disease
- Over watering leads to shallow roots, increased thatch, and an environment that promotes fungal disease and weed growth
